# Introduction to Machine Learning

Wenting Tu

SHUFE, SIME

Machine Learning and Deep Lerning

Course No. 1638

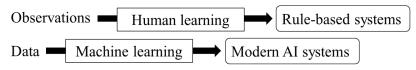

#### Outline

#### What is Machine Learning

Practical Applications of Machine Learning

### What is Machine Learning

Rule-based systems VS Learning-based systems

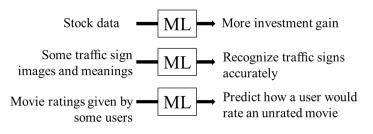

- Issues with rule-based systems
  - · Very labor intensive to build.
  - · Only work very well for areas they cover.
  - · Don't naturally handle uncertainty.

Disappointment in expert systems (late 80s / early 90s) led to an "AI Winter".

#### Formal Definition

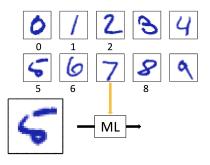

A computer program is said to learn from *experience* E with respect to *some class of tasks* T and *performance measures* P, if its performance at tasks in T, as measured by P, improved with E.

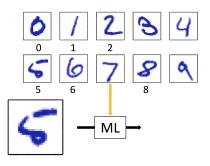

- About Data
- Instance / Example
- Attribute / Feature
- Feature vector
- Feature space / Input space
- Label
- Label space / Output space

- About session
  - Training/Learning
  - Testing

- About task
  - Classification
  - Regression

- About task
  - Clustering

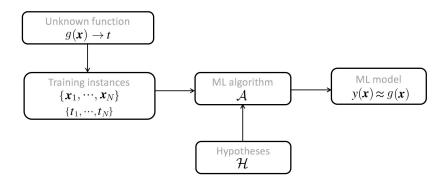

- About learning
- Supervised learning
- Unsupervised learning
- Semi-supervised learning
- Transfer learning
- Life-long learning

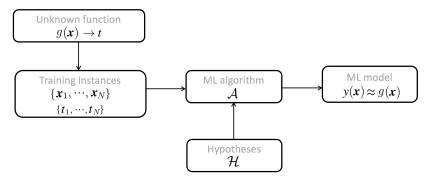

- About learning
  - Reinforcement learning

### How (supervised) ML works

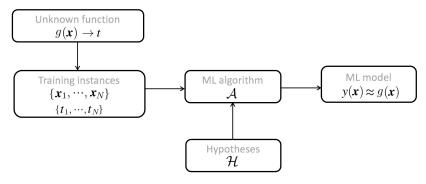

## Empirical risk minimization

- Loss function
  - L(t, y(x))
- Expected risk

$$\mathbb{E}[L] = \iint L(t, y(x)) p(x, t) dx dt$$

### Empirical risk minimization

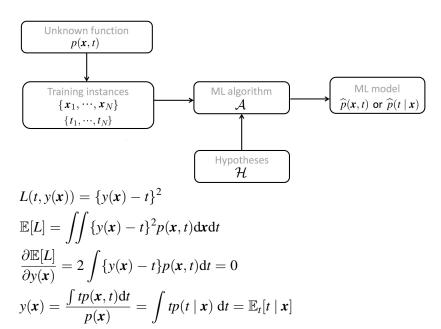

Empirical risk

$$E = \sum_{n=1}^{N} L(t_n, y(\boldsymbol{x_n}))$$

Empirical risk minimization
 y\* = arg min E

# Decision Theory (for Regression)

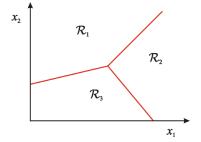

• Binary and multiclass classification

$$\{C_k\} = \{-1, +1\}$$
  
 $\{C_k\} = \{1, \dots, K\}$ 

• Decision Regions and Boundaries

$$\mathcal{R}_k = \{ \boldsymbol{x} | y(x) \to \mathcal{C}_k \}$$

• Optimal decision for binary classification  $p(\text{mistake}) = p(\mathbf{x} \in \mathcal{R}_1, \mathcal{C}_2) + p(\mathbf{x} \in \mathcal{R}_2, \mathcal{C}_1)$ 

$$\begin{aligned} \text{stake}) &= p\left(\mathbf{x} \in \mathcal{R}_1, \mathcal{C}_2\right) + p\left(\mathbf{x} \in \mathcal{R}_2, \mathcal{C}_1\right) \\ &= \int_{\mathcal{R}_1} p\left(\mathbf{x}, \mathcal{C}_2\right) d\mathbf{x} + \int_{\mathcal{R}_2} p\left(\mathbf{x}, \mathcal{C}_1\right) d\mathbf{x} \end{aligned}$$

$$\mathcal{R}_1 = \{ \boldsymbol{x} | p\left(\boldsymbol{x}, \mathcal{C}_1\right) > p\left(\boldsymbol{x}, \mathcal{C}_2\right) \}$$

$$\mathcal{R}_{2} = \{ \boldsymbol{x} | p(\boldsymbol{x}, \mathcal{C}_{1}) > p(\boldsymbol{x}, \mathcal{C}_{2}) \}$$

$$p(\boldsymbol{x}, \mathcal{C}_{k}) = p(\mathcal{C}_{k} | \boldsymbol{x}) p(\boldsymbol{x})$$

$$\mathcal{R}_k = \{ \boldsymbol{x} \mid p(\mathcal{C}_k | \boldsymbol{x}) \text{ is largest } \}$$

• Optimal decision for multiclass classification

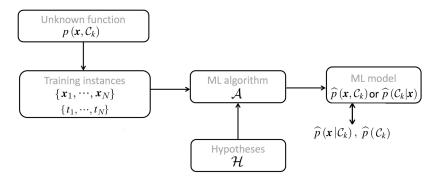

$$p(\text{mistake}) = \sum_{k=1}^{K} \sum_{j \neq k} p\left(\boldsymbol{x} \in \mathcal{R}_{j}, \mathcal{C}_{k}\right) = \sum_{k=1}^{K} \sum_{j \neq k} \int_{\mathcal{R}_{j}} p\left(\boldsymbol{x}, \mathcal{C}_{k}\right) d\boldsymbol{x}$$
$$p(\text{correct}) = \sum_{k=1}^{K} p\left(\boldsymbol{x} \in \mathcal{R}_{k}, \mathcal{C}_{k}\right) = \sum_{k=1}^{K} \int_{\mathcal{R}_{k}} p\left(\boldsymbol{x}, \mathcal{C}_{k}\right) d\boldsymbol{x}$$
$$\mathcal{R}_{k} = \{\boldsymbol{x} \mid p\left(\mathcal{C}_{k} | \boldsymbol{x}\right) \text{ is largest } \}$$

• The role of class posterior probability

$$\mathbb{E}[L] = \sum_{k} \sum_{j} \int_{\mathcal{R}_{j}} L_{kj} p\left(\boldsymbol{x}, \mathcal{C}_{k}\right) d\boldsymbol{x}$$

$$\mathcal{R}_{j} = \left\{ \boldsymbol{x} \left| \sum_{k \neq j} L_{kj} p\left(\mathcal{C}_{k} | \boldsymbol{x}\right) \right. \right.$$
 is smallest  $\left. \right\}$ 

• The role of class posterior probability
